

Sentinel 2, 27. August 2016

# Evaluation of satellite-based snow coverage information with surface observations

Jörg Trentmann, Vivien Priemer, Kai Werth, Uwe Pfeifroth, Richard Müller  
Deutscher Wetterdienst      Universität Frankfurt      Universität Mainz

# Satellite-based Snow Data Records

## CyroClim

- Provided by MetNo
- High spatial (5 km) and temporal (daily) resolution
- Available 1993-2009
- Based on multiple satellite instruments

## IMS

- Interactive Multisensor Snow and Ice Mapping System vom National Ice Center (US)
- Uses a number of satellite information, since Dec. 2014 also in situ data
- Provided daily from 1997 to today
- Spatial resolution 24 km, 4 km (since 2004), 1 km (since 2014)
- Northern hemisphere

# Surface Solar Radiation Dataset – Heliosat (SARAH)

## → Variables

- Global irradiance (SIS)
- Direct normalized irradiance (DNI)
- Effective cloud albedo (CAL)

## → Resolution

- Spatial:  $0.05^\circ \times 0.05^\circ$
- Temporal: hourly, **daily**, monthly means

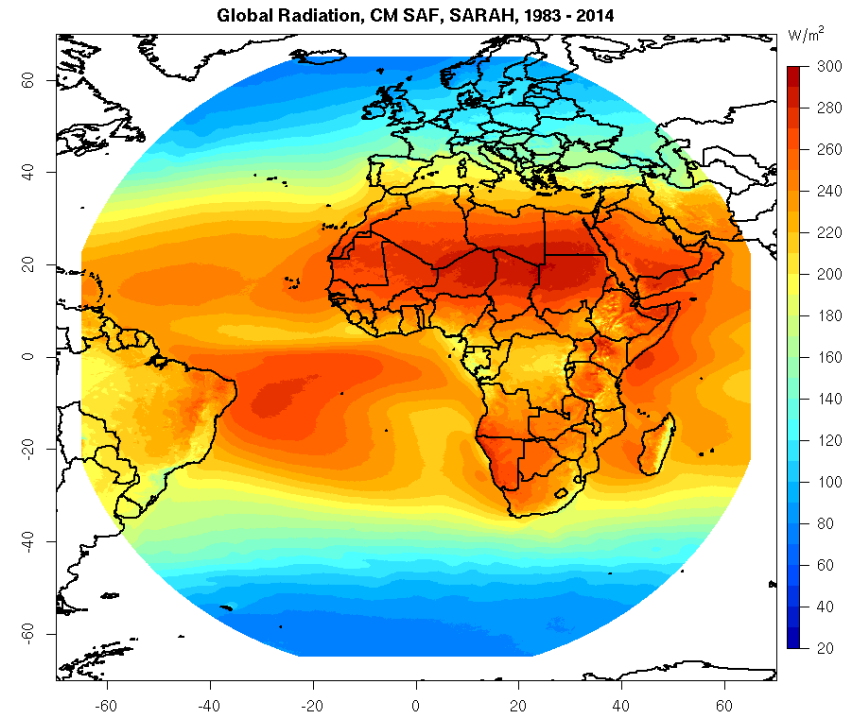

## → Coverage

- Spatial: Meteosat-Prime Full disk
- Temporal: 1983 to 2016

## → Satellites / Instruments

- Meteosat 2 to 10 (MVIRI/SEVIRI)

## → ‘Heliosat’-retrieval method

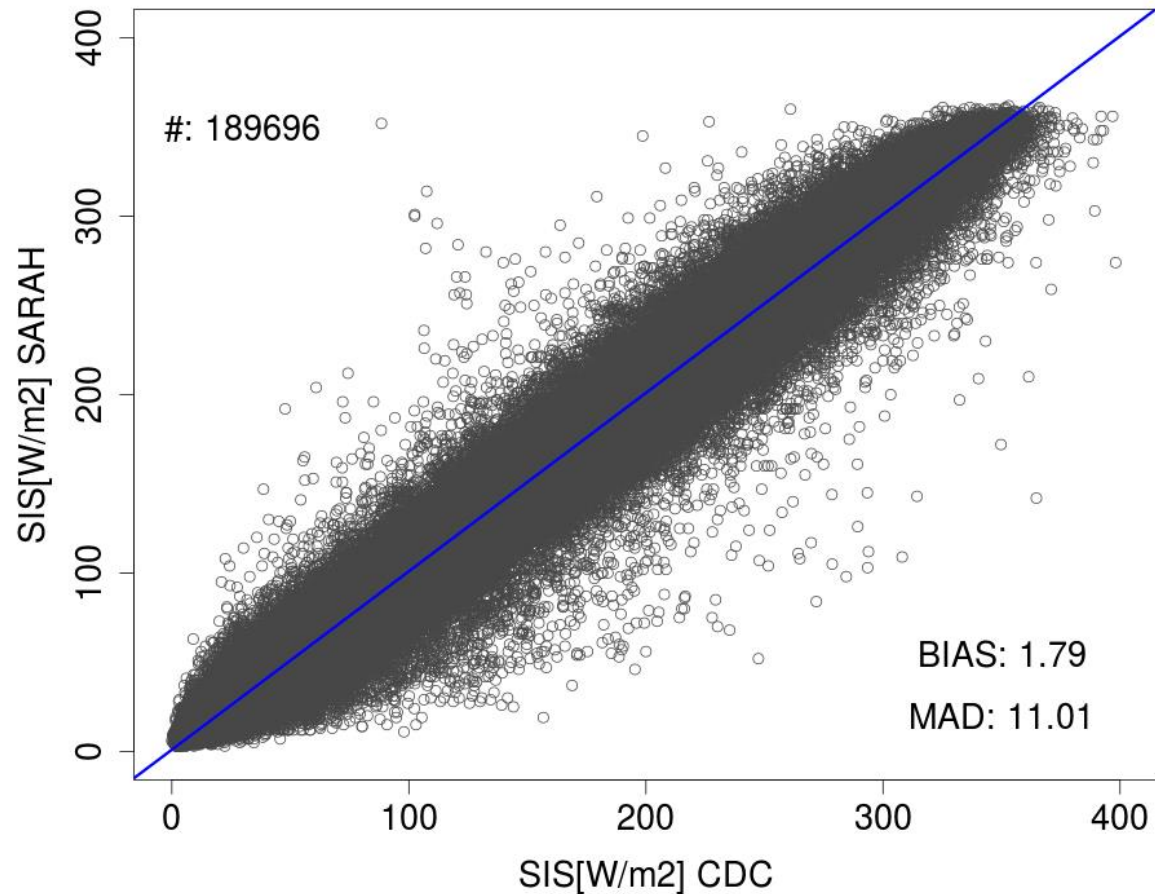

# Motivation

## Global Radiation

- CM SAF SARA  
Climate data record
- Excellent  
agreement with  
surface  
measurements

Global irradiance\_1983-01-01\_2015-12-31\_allstations

# Global irradiance\_1983-01-01\_2015-12-31\_allstations

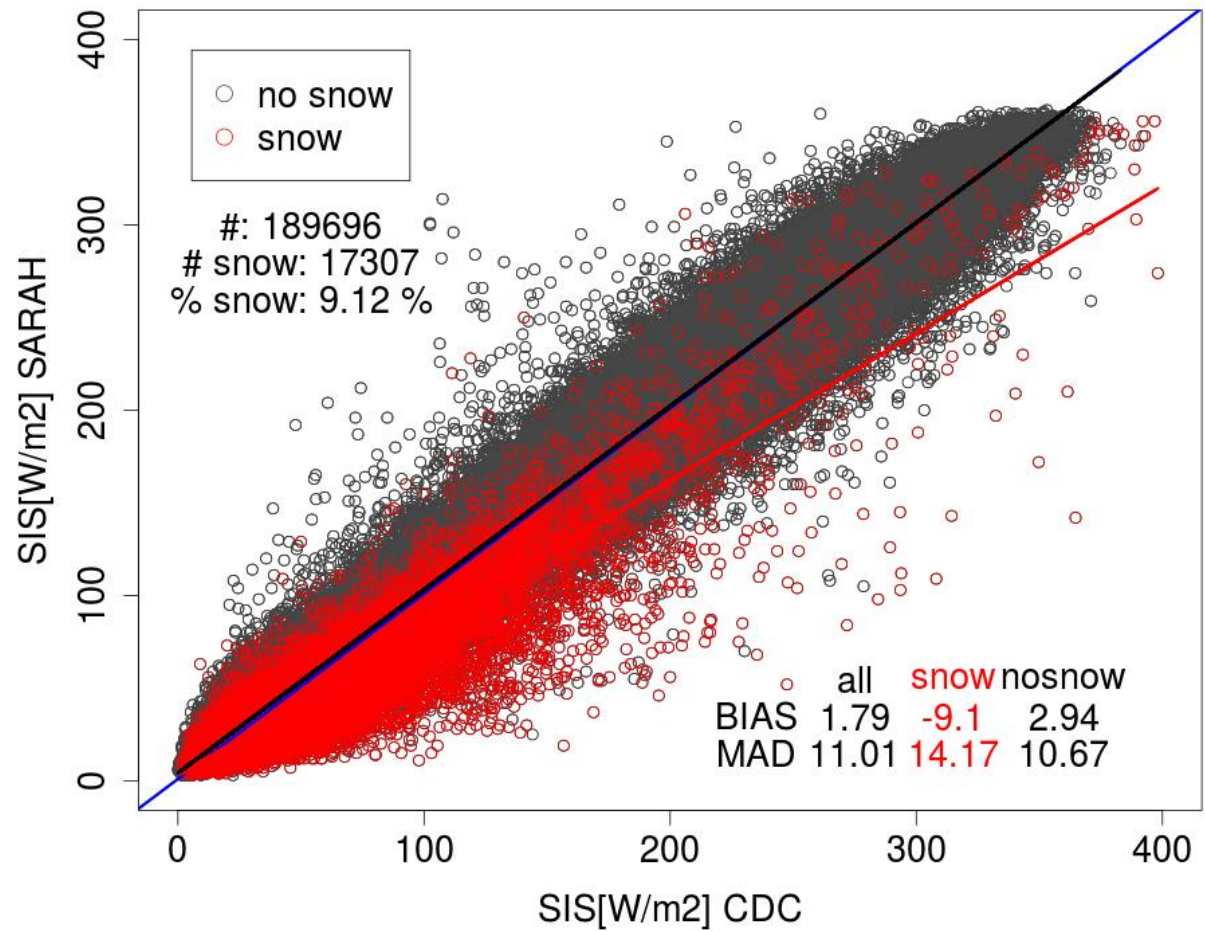

- Systematic under-estimation of surface radiation in snow-covered situations

March

BIAS\_snow:  $-21.47 \frac{W}{m^2}$

MAD\_snow:  $25.73 \frac{W}{m^2}$

- Problem:  
Snow is classified as cloud

# Schneeerkennung

## HelSnow

- *Starting Point:*  
Separation between cloud and snow  
based on early satellite data  
problematic (only 3 spectral channels  
available)
- *Solution:*  
Separation between Cloud and Snow  
based on ‚motion‘
- *Intelligent / modern / efficient*  
programming (OpenCV: ‚optical  
flow‘) allows the processing of long  
time series

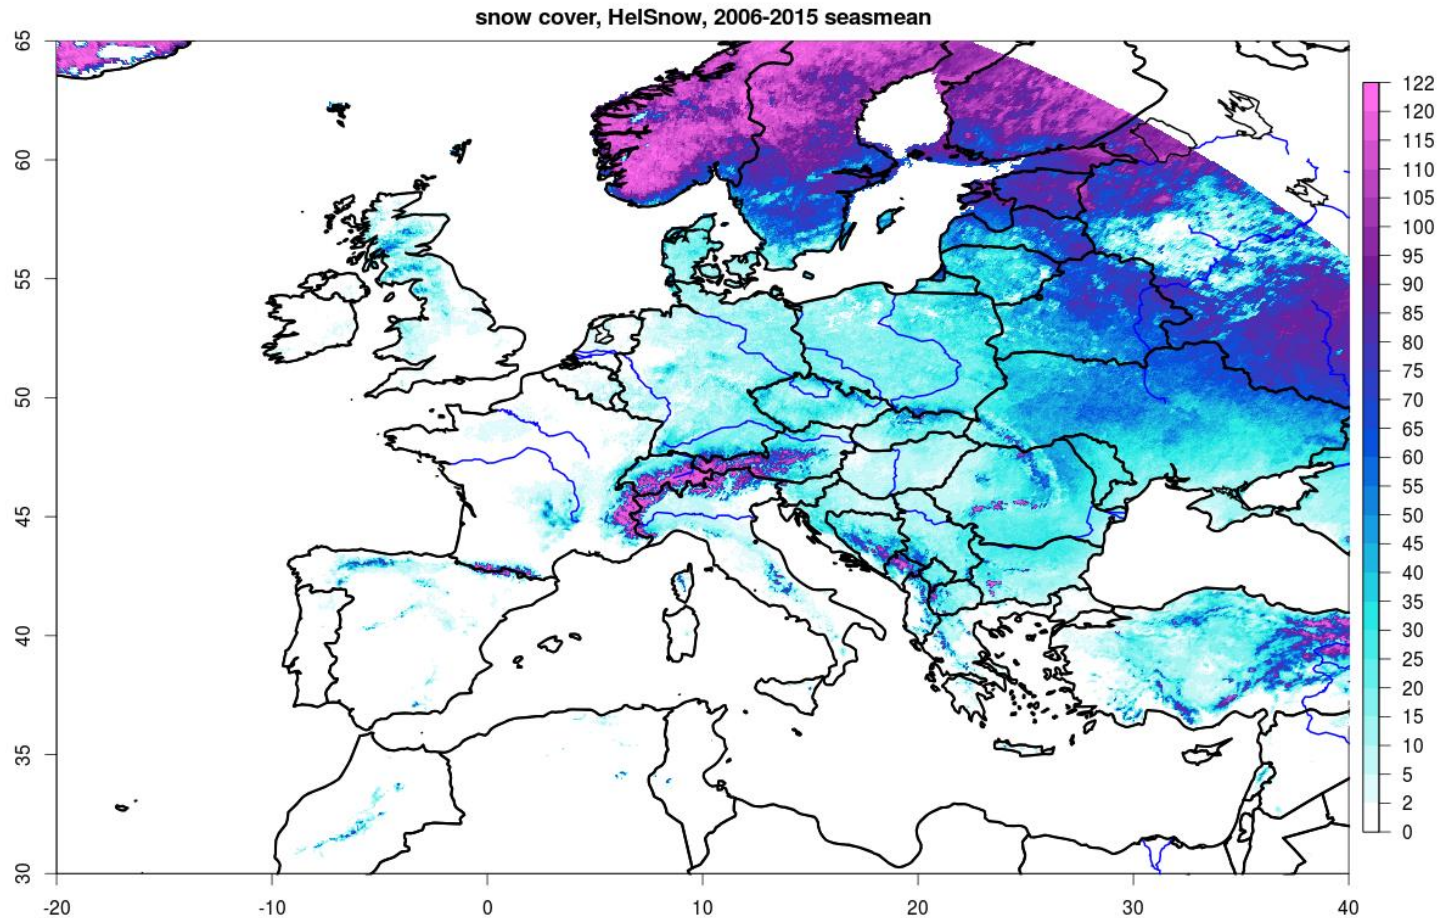

18 March 2006, 1200 + 1230 UTC

Optical flow between the satellite images for March 12, 2006 12:00 and 12:30

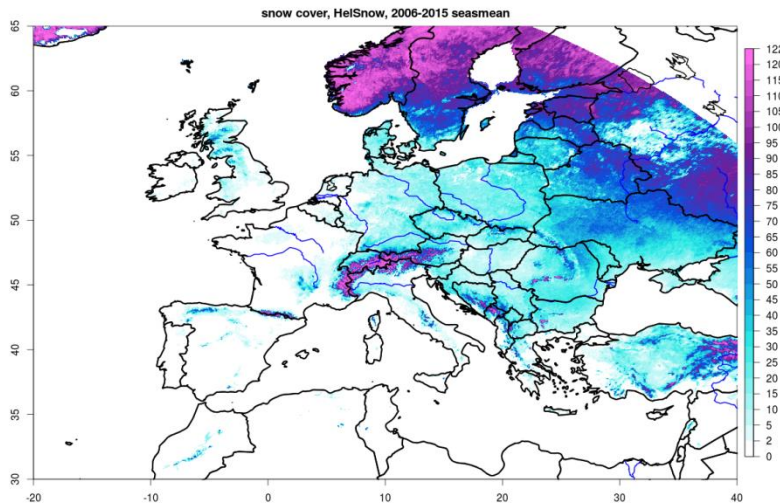

# Mean Number of Snowdays, DJFM, 2006 - 2015

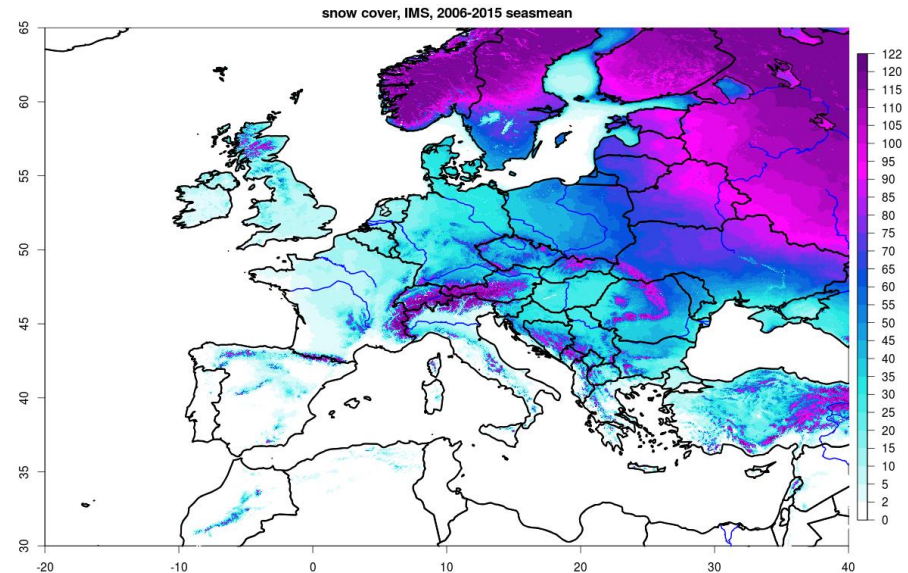

# Mean Number of Snowdays, DJFM, 2006 - 2015

## HelSnow

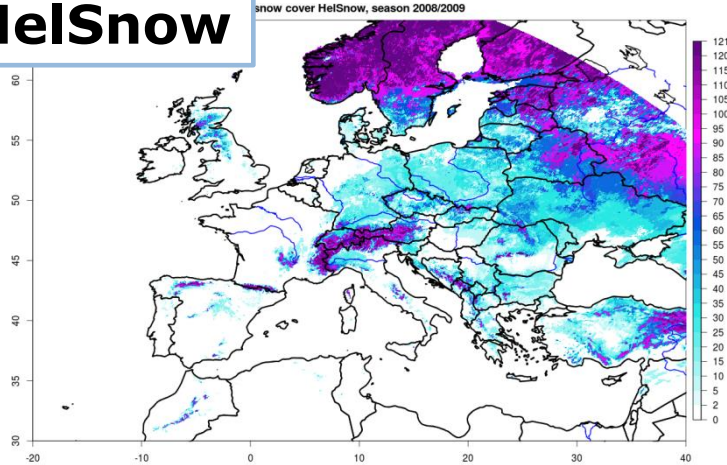

## IMS

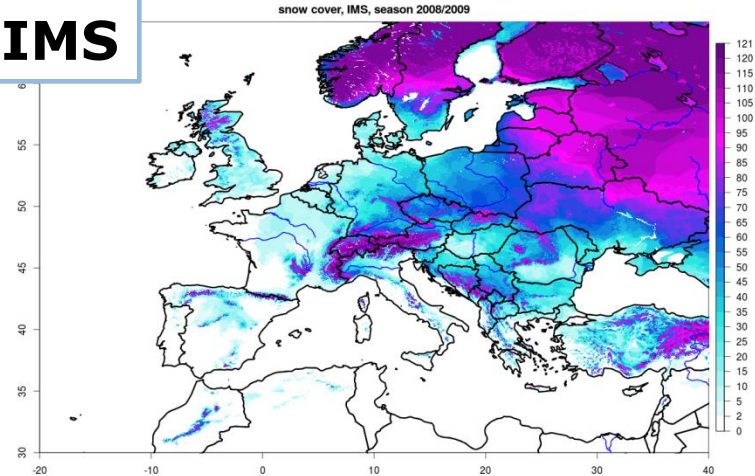

- General structure well reproduced by HelSnow
- HelSnow tends to identify fewer snow days than IMS

# Mean Number of Snow days, DJFM, 2008 / 2009

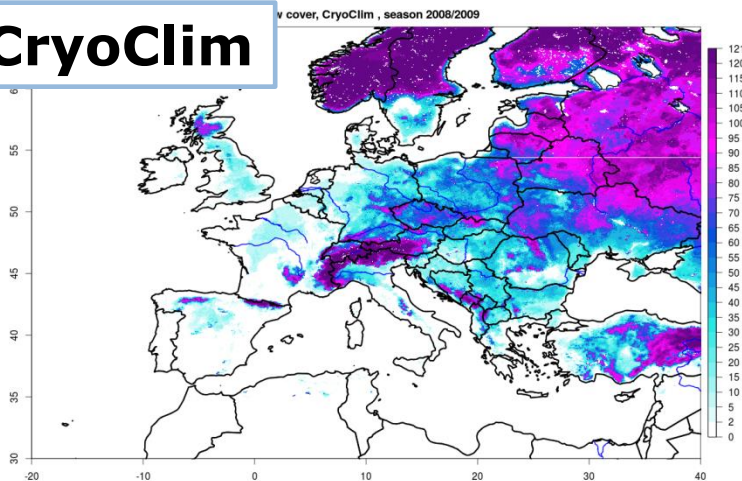

## HelSnow

## IMS

## CryoClim

- ➔ General structure well reproduced by HelSnow
- ➔ HelSnow tends to identify fewer snow days than IMS and CryoClim

# Evaluation: Number of Snow days, DJFM, 1993 - 2015

snowdays/season\_4642\_Seeha

snowdays/season\_1048\_Dresden-Klotzsche

# Evaluation: Number of Snow days, DJFM, 1993 - 2015

snowdays/season\_1832\_ **Großer Arber**

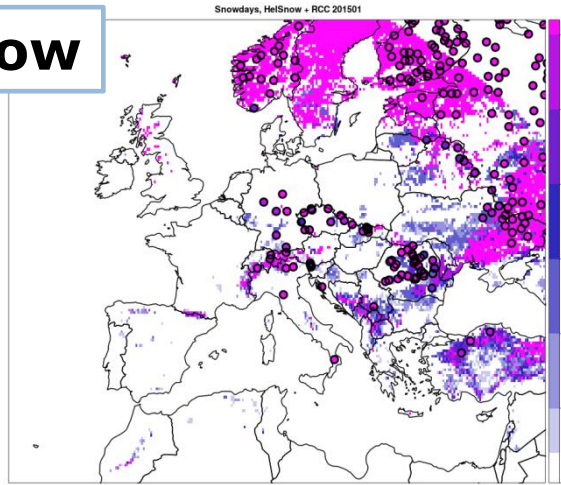

snowdays/season\_3513\_ **Neuhaus / Rennsteig**

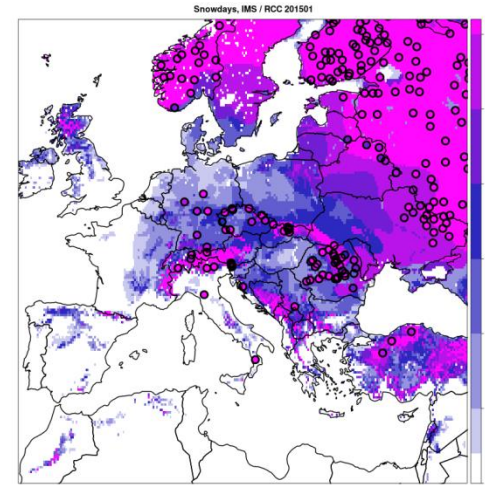

# Mean Number of Snow days, January 2015

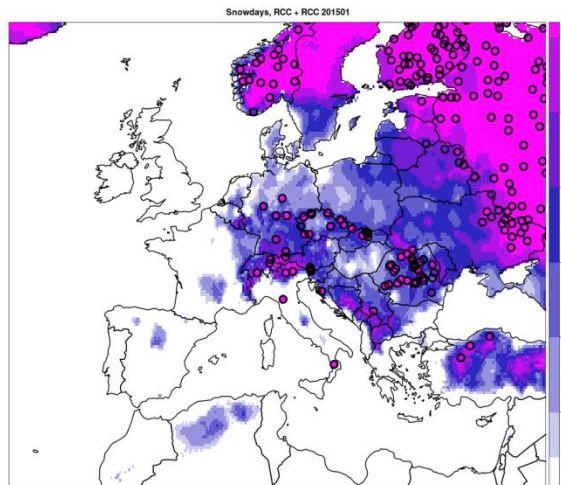

**HelSnow**

**IMS**

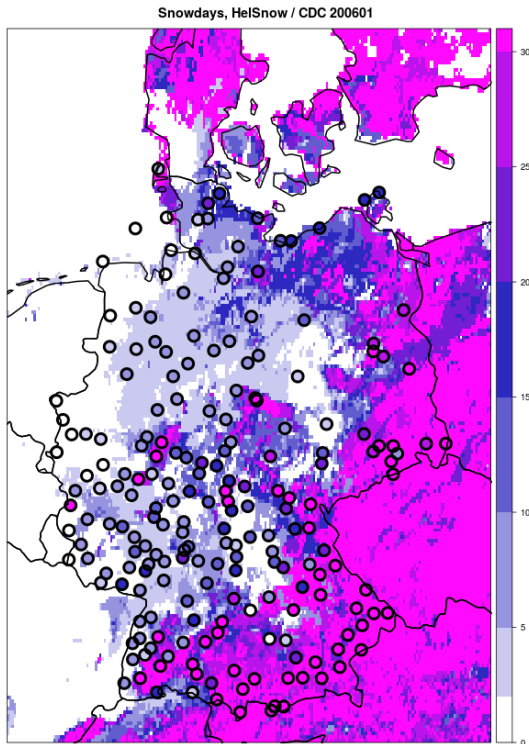

**RCC**

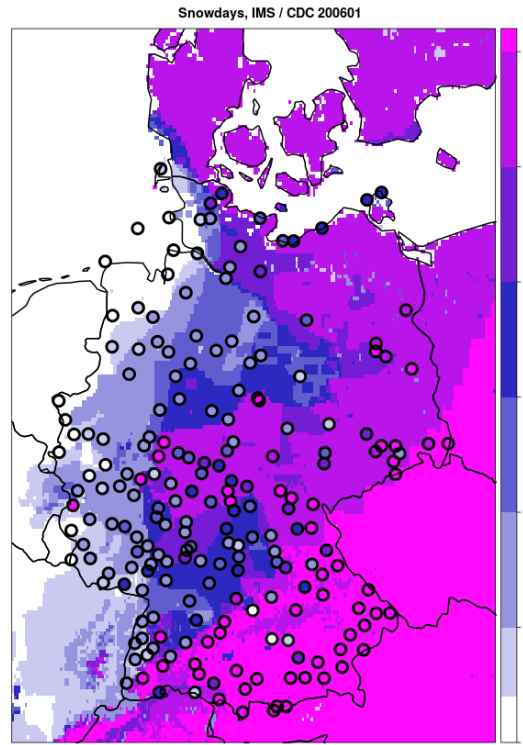

- IMS and RCC (station-based gridded) compare well
- HelSnow tends to underestimate number of snow days

# January 2006; Number of Snow days

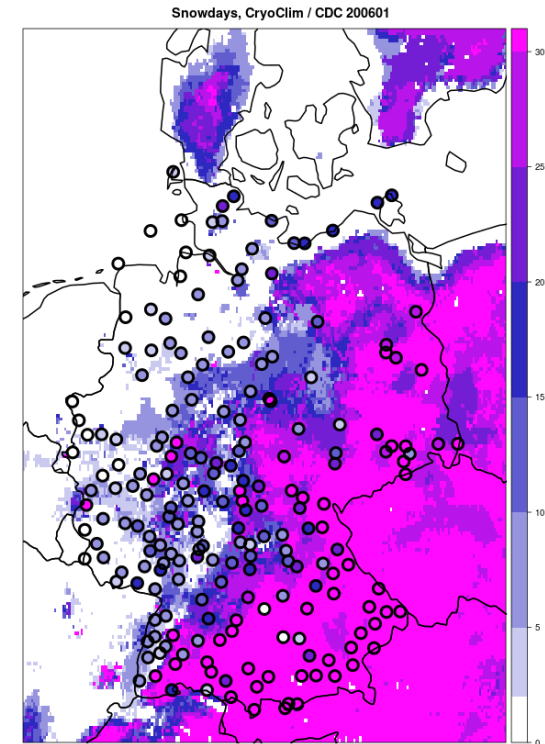

## HelSnow

## IMS

## CryoClim

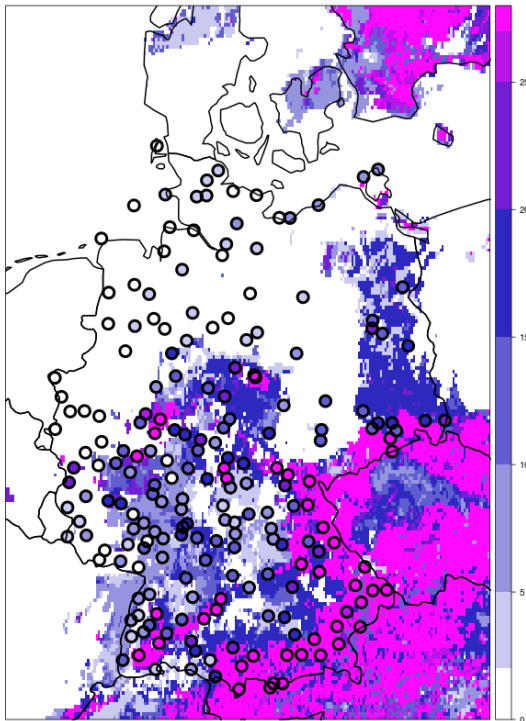

➔ Larger-scale snow coverage in IMS; more realistic?

## February 2006

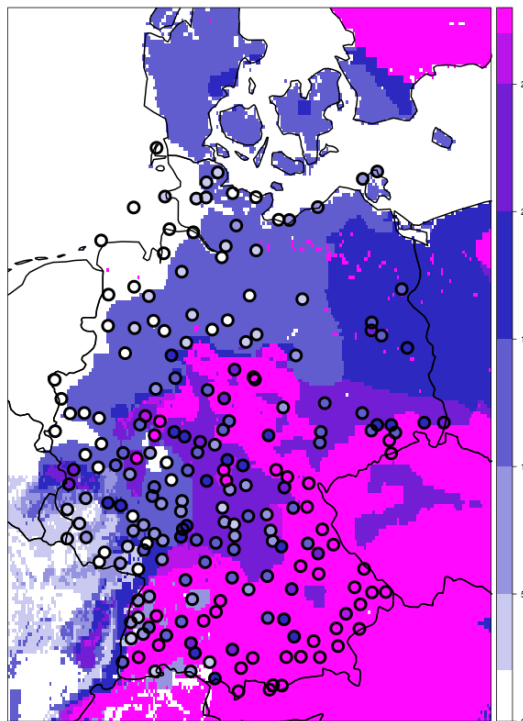

### HelSnow

Snowdays, HelSnow / CDC 200602

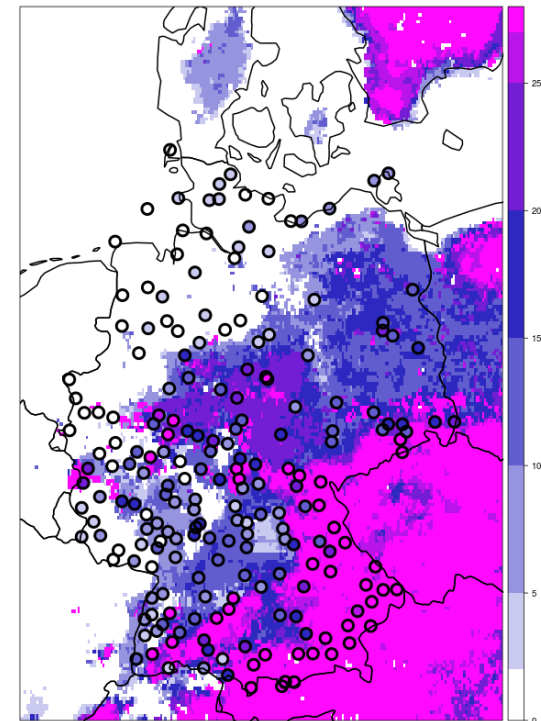

### IMS

Snowdays, IMS / CDC 200602

### CryoClim

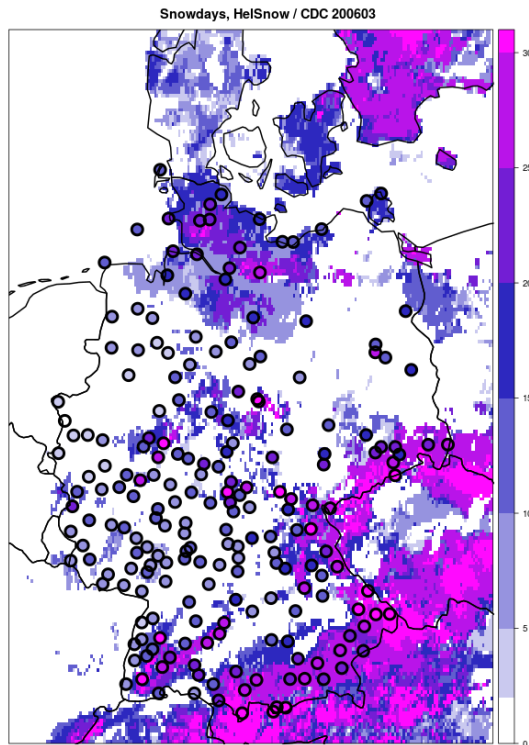

Snowdays, CryoClim / CDC 200602

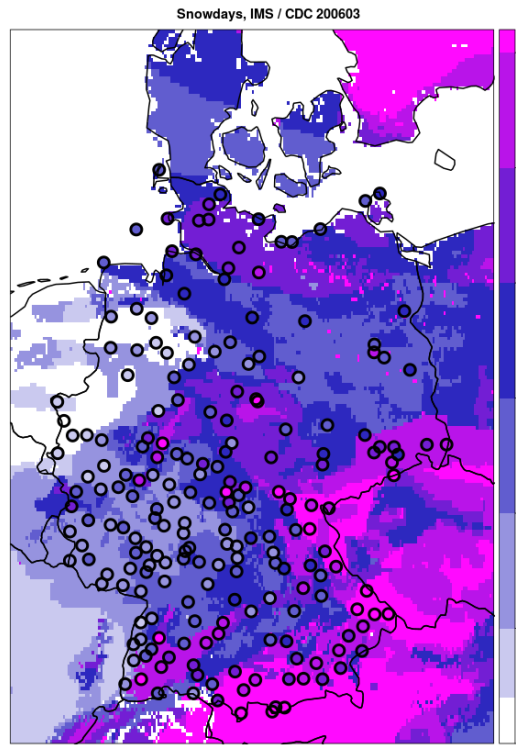

➔ IMS seems to overestimate snow coverage; strong gradients in HelSnow

## March 2006

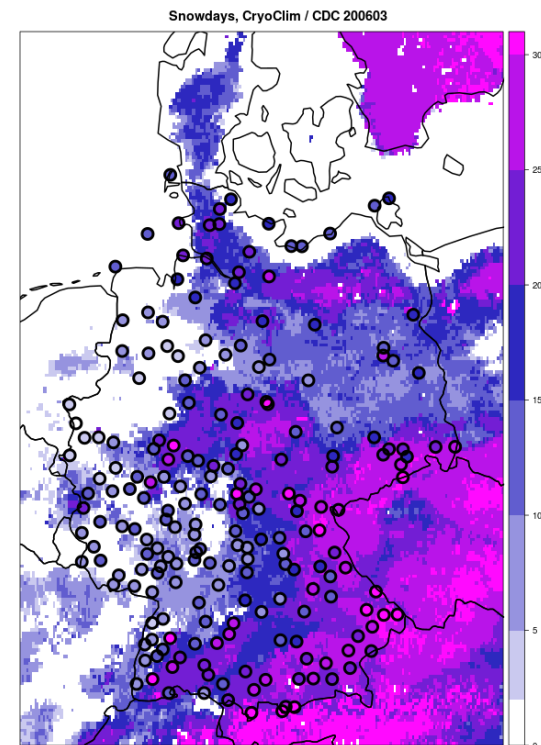

### HelSnow

### IMS

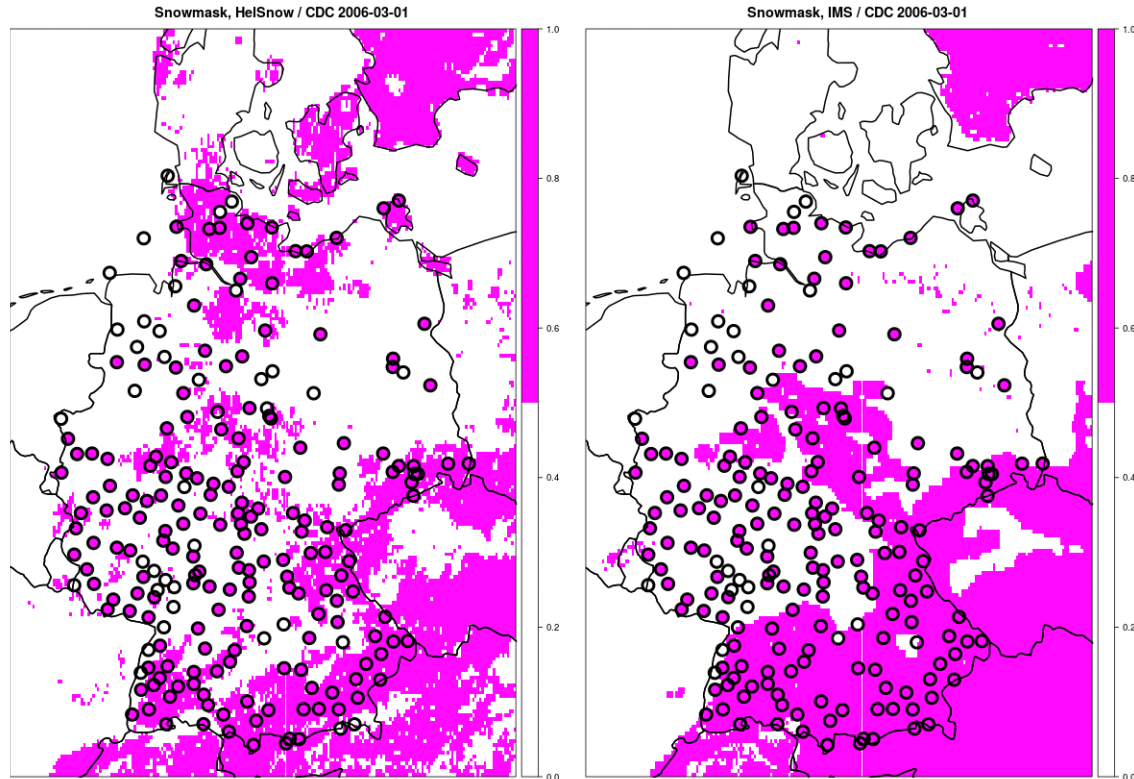

### CryoClim

➔ HelSnow underestimates snow coverage in some areas

# Snow Mask March 2006

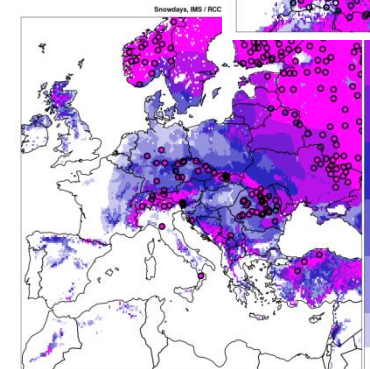

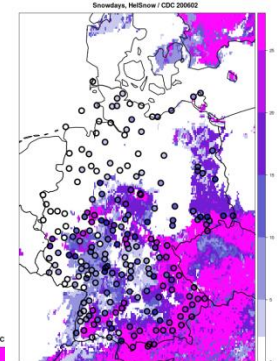

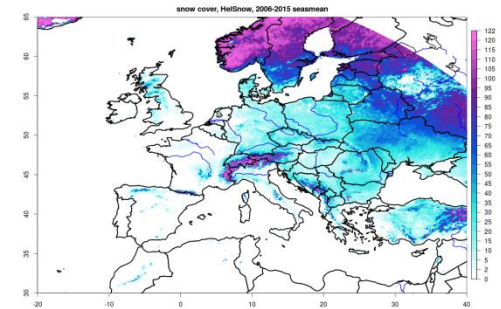

## Scores (DJFM, Germany)

<i>scores</i>	<b>HelSnow</b> (2006-01-01 – 2015-12-31)	<b>IMS</b> (2006-01-01 – 2015-12-31)	<b>CryoClim</b> (1993-01-01 – 2009-03-31)	<b>best value</b>	<b>always snow</b> (2006-01-01 – 2015-12-31)	<b>never snow</b> (2006-01-01 – 2015-12-31)
<b>ACC</b>	0.78	0.85	0.74	1	0.28	0.7
<b>CSI</b>	0.32	0.61	0.40	1	0.28	0
<b>FAR</b>	0.23	0.27	0.39	0	0.72	NA
<b>POD</b>	0.36	0.79	0.54	1	1	0
<b>POFD</b>	0.04	0.12	0.16	0	1	0
<b>BIAS</b>	0.46	1.09	0.88	1	5.02	0
<i><b>Skill scores</b></i>						
<b>ETS</b>	0.23	0.48	0.24	1		
<b>PSS</b>	0.31	0.66	0.38	1		
<b>HSS</b>	0.37	0.65	0.39	1		
<b>ORSS</b>	0.84	0.93	0.72	1		

- IMS performs best (according to these scores)
- HelSnow underestimates the frequency of snow; lowest FAR, POFD
- CryoClim and HelSnow have comparable performance

## Summary

- ➔ No consistent, large-scale climate data record of snow coverage available; satellite data have to potential to provide this information
- ➔ Modern algorithms allow the retrieval of snow coverage from historical Meteosat data despite the limited spectral information
- ➔ Results from the HelSnow-algorithm are satisfactory
- ➔ HelSnow allows the snow detection in historical satellite data; high potential for further developments
- ➔ Consistent and homogeneous 33-year time series of snow coverage soon available
- ➔ Improvement of the CM SAF SARA data record of surface solar radiation over snow

## Meteosat Satelliten (EUMETSAT)

### 1. Generation (MVIRI) (1982- 2006)

- 3 spektrale Kanäle
- Zeit: 30 min
- Raum: 5 km

### 2. Generation (SEVIRI) (1984 - ~ 2020)

- 11 spektrale Kanäle
- 5 min bis 15 min
- 5 km / 1 km

### 3. Generation (FCI) (ab ~ 2020)

- 16 spektrale Kanäle
- 2.5 min bis 10 min
- 500 m / 1 km / 2 km
